Integrative OncoGenomics

IntOGen, a discovery tool for cancer researchers, is a resource that integrates multidimensional OncoGenomics Data for the identification of genes and groups of genes (biological modules) involved in cancer development.

Please note: IntOGen is **UNDER DEVELOPMENT**. The results shown are preliminary and the browser is a beta version, errors may be found and we are currently working to fix them.

If you are interested in using IntOGen and would like to be informed when new options are added [subscribe to the IntOGen mailing list](#).

YOUR MODULES**

Gene Search

Search for a gene of interest and have a wide view of the implication of this gene in cancer

Experiment search

Search for a experiment and identify the most significant genes and modules altered

Tumor type search

Search for a cancer type of interest and discover the most significant altered genes and modules

Cancer Gene Prioritization

Prioritize a list of candidate genes based on CGPrio probabilities and oncogenomic alterations

Combine experiments

Choose a group of experiments and combine the statistics to obtain combined significant genes and modules

Analyze your modules

Load your own modules and find out if they are enriched for genes significantly altered in different cancer types

- IntOGen is a novel framework for **Oncogenomics data** integration and analysis
- It **integrates** many tumor types and different types of alterations in a common framework
- It explores the data at **different levels**, from individual experiments to combinations of experiments, and from individual genes to biological modules
- The system is updatable, **flexible** and extensible
- It incorporates an intuitive web system designed to be a **discovery tool** for cancer researchers (www.intogen.org)
- It will allow to store, analyze and visualize data coming from **next generation sequencing** technologies
